

ABSTRACT

A method for asynchronously retrieving information. Such a method may include: invoking a process in a subscribing server; registering, by the process, an event request with an event server; requesting, by the process over a first connection, resource information from a originating server, the first connection being disconnected after the requesting; receiving, by the event server over a second connection, event information from the originating server, the second connection disconnected after the receiving; and transferring, to the process from the event server, the event information.
